Rahul Balajee

AI Platform Engineer | Go (Golang) | Python | FastAPI | Distributed Systems | Docker | Kubernetes | AWS | Building High-Scale Backend Platforms | Open to Relocate
Berlin, Germany

Summary

AI Platform Engineer with 5+ years of experience building high-scale distributed systems using Go, Python, Kubernetes, and cloud infrastructure (AWS/GCP). I specialize in designing resilient microservices and backend platforms that support high-traffic workloads, including live streaming infrastructure and enterprise-scale backend systems.

Key Highlights

- Built an AI-powered troubleshooting platform using Python and FastAPI, integrating Slack, internal backend APIs, cloud provider APIs, and LangChain to autonomously investigate incidents, correlate signals, and identify probable root causes.
- Migrated legacy backend systems to Go-based microservices using Redis and DynamoDB, reducing latency from 800ms to <300ms while cutting infrastructure costs by 25%.
- Designed event-driven microservices and monitoring systems for high-traffic live streaming platforms serving global audiences.
- Built internal CLI tooling in Go (Cobra) used by engineering and support teams to manage 1000+ multi-tenant environments.
- Implemented multi-CDN load balancing using Akamai GTM across Fastly, Limelight, and Google CDN with zero-downtime deployments.
- Designed observability platforms using OpenTelemetry (OTel) with exporters such as Prometheus and Datadog, and implemented CloudWatch alarms, improving incident response times by 45%.
- Designed observability platforms using OpenTelemetry (OTel) with exporters such as Prometheus and Datadog, and implemented CloudWatch alarms, improving incident response times by 45%.

I enjoy solving distributed systems problems, designing scalable backend architectures, and improving developer productivity through platform tooling. Currently open to backend engineering opportunities across Europe.

Experience

Brightcove

5 years 8 months

AI Platform Engineer

January 2024 - Present (2 years 7 months)

Puducherry

Designed and delivered event-driven Golang microservices for a live stream monitoring platform handling high-traffic global events. Applied hexagonal architecture, pub/sub messaging, worker pools and concurrency patterns to improve reliability, scalability and failure isolation.

Built an AI-powered troubleshooting platform using Python and FastAPI, integrating Slack, internal backend APIs, cloud provider APIs, and LangChain to autonomously investigate incidents, correlate signals, and identify probable root causes.

Designed scalable REST and gRPC APIs for backend services, focusing on clean service boundaries, efficient request handling and reliable inter-service communication across high-traffic production environments.

Built production-grade internal CLI in Go (Cobra, Viper) used across engineering and support teams to manage configuration for 1000+ multi-tenant customer environments, reducing manual operations and improving developer productivity by 30%.

Deployed and operated containerized backend services across Kubernetes (AWS EKS and GCP GKE), implementing Helm charts, RBAC policies and Argo CD GitOps workflows to standardize releases across environments.

Established end-to-end observability using Prometheus, Datadog and Jaeger; defined actionable metrics, dashboards and alerts integrated with PagerDuty, reducing Mean Time to Resolution and improving system visibility.

Partnered with backend, DevOps and SRE teams to improve API design, developer workflows and platform standards, helping teams ship services faster while maintaining reliability at scale.

Systems Engineer

December 2020 - December 2023 (3 years 1 month)

Puducherry

Built a Go-based authentication and user service integrating OAuth2, PostgreSQL and token-based session handling to support secure multi-tenant backend APIs used by upstream services.

Contributed to a multi-CDN orchestration system using Akamai GTM with Fastly, Limelight and CloudFront, enabling real-time traffic switching and supporting over 10M concurrent viewers with zero downtime during major events.

Developed CloudWatch dashboards and automation scripts to optimize Kubernetes resource utilization, improving infrastructure efficiency and reducing operational overhead.

Led migration of engineering documentation into a unified mono-repo, improving onboarding and deployment workflows and increasing documentation update speed by ~45%.

Education

Pondicherry University

Bachelor of Technology - BTech, Electronics and Instrumentation Engineering · (2015 - 2019)

EC-Council University

Certified Ethical Hacker (CEH) · (June 2020 - November 2020)
